CONTENTS

Business Understanding	01
Overview of Customer 360 & RFM Analysis	02
Determine Customer Segments	07
Customer Analysis and Solutions	15
SQL Code and Customer List by Segments	23

1. BUSINESS UNDERSTANDING

WHAT

Segment existing customers into distinct, well-defined groups with clear characteristics, label each segment, so the CS team can easily identify them, and propose tailored care policies per group.

WHY

The marketing team is running a year-end campaign that requires personalized outreach. Treating all customers the same wastes CS resources and reduces conversion. Segmentation allows smarter, more targeted engagement, improving campaign effectiveness.

WHO

The output is used by the CS team and the Marketing team.

WHERE

Data comes from the collected datasets of customers who registered for the membership program and from customer transaction history.

WHEN

The analysis covers the period from June 2022 to August 2022.

HOW

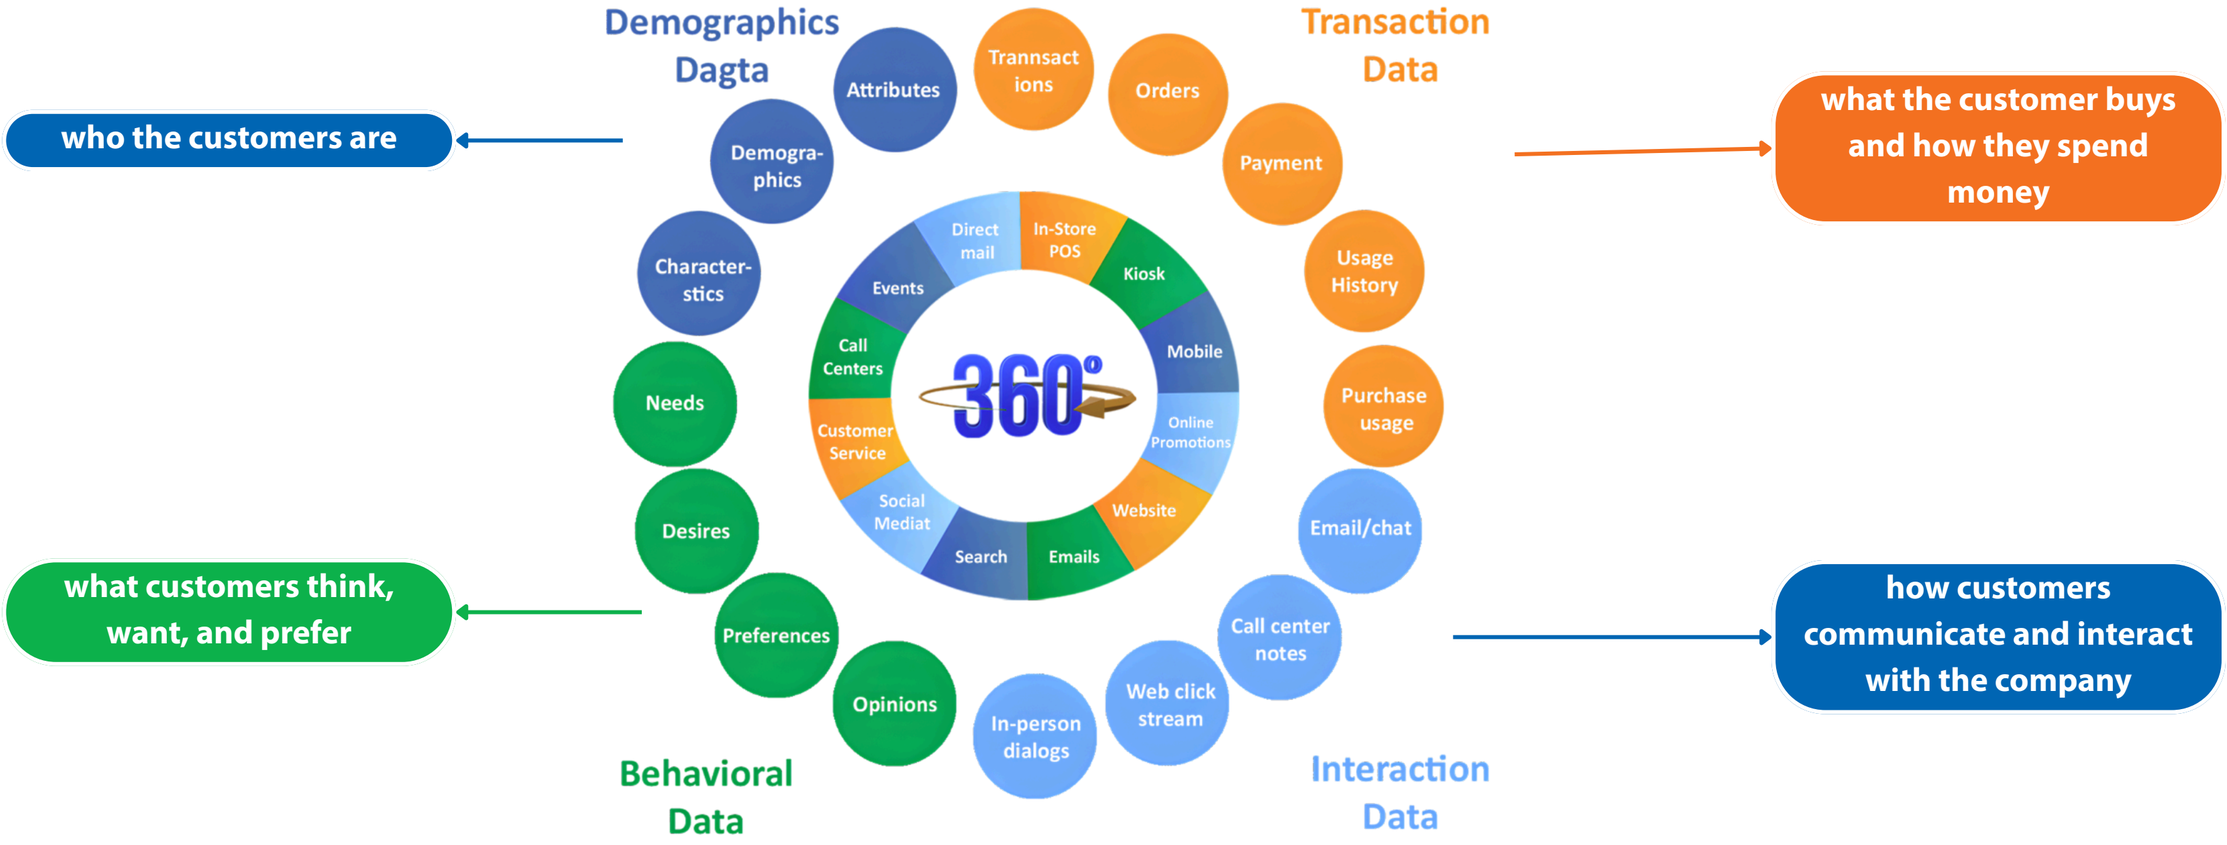
1. Calculate RFM scores (Recency, Frequency, Monetary) for each customer.
2. Segment customers based on RFM scores and BCG Matrix.
3. Analyze each group and propose targeted implementation plans for CS and Marketing teams.

02

Overview of Customer 360 & RFM Analysis

2.1. WHAT IS CUSTOMER 360 ?

Customer 360 provides a complete and unified view of each customer by integrating data from all touchpoints and systems across an the company into a single source of truth.



2.2. WHY IS CUSTOMER 360 IMPORTANT ?

01

Improve Personalized Customer Experience

With comprehensive customer insights, companies can offer products and services tailored to individual customer expectations. This encourages customers to spend more, stay loyal, and recommend the products or services to others.

02

Reduce Churn Rate

Companies can identify at-risk customers early by analyzing customer behavior and interaction data. This allows them to take proactive actions to retain customers and improve long-term loyalty.

03

Increase Sales Revenue

Customer 360 enables companies to implement effective upselling and cross-selling strategies. In addition, a complete view of the customer helps uncover their current needs, making it easier to convert leads into customers.

04

Optimize Business Processes

Different departments can easily access the data they need from a unified system. This improves cross-team collaboration and enables the automation of many manual tasks.

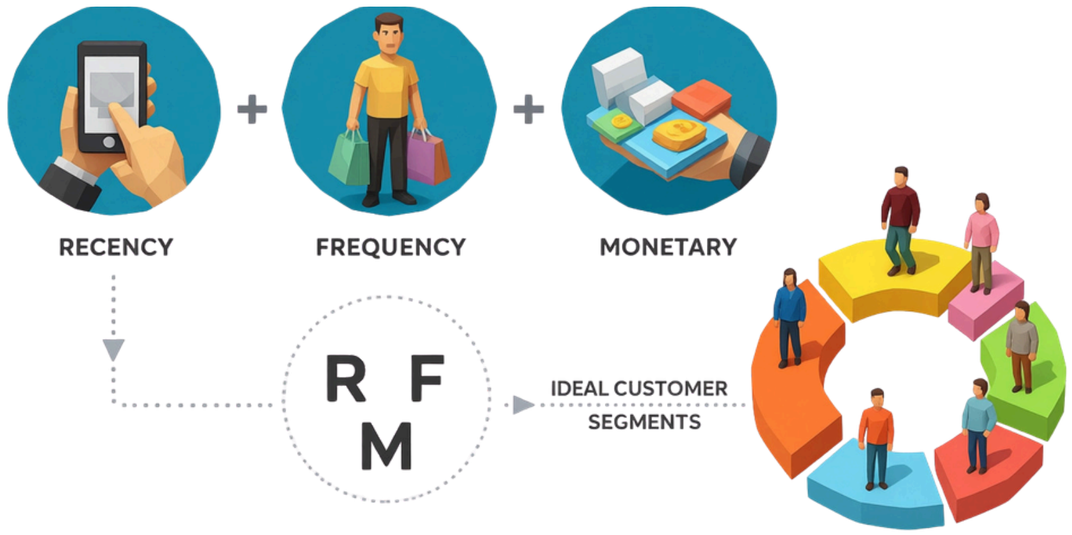
05

Better Data-Driven Decision Making

Customer 360 provides managers and analysts with a clearer and more accurate picture of customer health, lifetime value, and segment performance. This supports smarter strategic planning and more accurate forecasting.

2.3. WHAT IS RFM ANALYSIS ?

RFM Analysis is a customer segmentation technique used to help businesses rank and segment customers based on three key factors: Recency, Frequency, and Monetary value of their transactions.



Recency

The time since a customer's most recent transaction or service usage.

Frequency

The number of times a customer makes purchases or uses the service within a specific period.

Monetary

The total revenue or profit generated from a customer.

2.4. WHY IS RFM ANALYSIS USEFUL?

01 Directly actionable, supporting customer lifecycle management

It reveals at-risk “churners” (low recency/frequency), VIPs (high across all metrics), and potential customers (high monetary value but low frequency), enabling businesses to design proactive strategies for different customer groups, improving customer lifecycle management and overall marketing effectiveness.

02 Easy to implement and interpret across departments

The RFM analysis is simple to implement using transactional data from a Customer 360 system. Its results are also easy to understand, allowing different departments such as marketing, sales, and customer service to quickly interpret customer behavior and take appropriate actions.

03 Easy to monitor and update over time

RFM scores can be easily updated as new transactional data becomes available in the Customer 360 system. This allows businesses to continuously track changes in customer behavior and adjust their marketing strategies accordingly.

04 Works well across many industries

RFM can be applied across a wide range of industries, including e-commerce, retail, and service-based businesses where customer transaction data is available.

2.5. APPLYING BCG MATRIX TO SEGEMENT CUSTOMER

The BCG Matrix (developed by the Boston Consulting Group) is a strategic framework used to classify products or business units based on market growth and market share. Companies can also appy this to segement customer like the picture below.

Star Customers who generate **high value** and **high engagement**. They purchase frequently and spend large amounts on the product/service.	**Question mark** Customers who show **high engagement** but **low purchase value**. They may be new or occasional buyers who are still exploring the product/service.
Cash cow Customers who generate **high value** but **lower growth in engagement**. They continue purchasing the product/service regularly and provide stable revenue.	**Dog** Customers who show **low value** and **low engagement**. They rarely purchase the product/service.

03 Determining Customer Segments

3.1. INTRODUCTION OF THE DATABASE USED FOR RFM ANALYSIS

In this project, **two data tables** are used to analyze and classify customers:

Customer_Transaction Table	
Column	**Description**
Transactions_ID	Unique ID of each transaction
CustomerID	ID of the customer who performed the transaction
Purchase_Date	Date when the customer made the purchase/transaction
GMV	Gross Merchandise Value of the transaction

Transaction_ID	CustomerID	Purchase_Date	GMV
0	1327813	2022-06-01	95,000
1	1157830	2022-06-01	75,000
2	873915	2022-07-01	95,000
3	3505071	2022-07-01	90,000
4	2930918	2022-07-01	109,091
5	899882	2022-06-01	105,000
6	2248818	2022-06-01	75,000
7	3331485	2022-06-01	90,000
8	3497579	2022-06-01	60,000
9	2636994	2022-07-01	75,000
10	3285167	2022-07-01	90,000
11	3725376	2022-07-01	70,000
12	1112691	2022-08-01	75,000
13	1425581	2022-08-01	95,000

Customer_Transaction Table: Contains detailed transaction of customers from June 2022 to August 2022

3.1. INTRODUCTION OF THE DATABASE USED FOR RFM ANALYSIS

Customer_Registered Table	
Column	**Description**
ID	Unique ID of the registered customer
Contract	Contract identification number
LocationID	ID of the subcompany branch location
Branchcode	Branch code corresponding to the location of branch
Status	Current status of the customer
Created_date	Date when the customer registered
Stop_date	Date when the customer cancelled the registration

ID	Contract	LocationID	BranchCode
2728894	HNJ154899	4	8
2728895	QAFD19618	510	0
2728896	HNJ154104	4	13
2728897	HNAAA3020	4	7
2728898	LAFD34958	72	0
2728899	HNAAA2804	4	6
2728900	HNJ154865	4	6
2728901	DTFD26529	67	0
2728902	HNAAA3011	4	7
2728903	BEFD23865	75	0

Status	created_date	stopdate
1	2022-01-05	[NULL]
1	2022-01-05	[NULL]
1	2022-01-05	[NULL]
1	2022-01-05	[NULL]
1	2022-01-05	[NULL]
1	2022-01-05	[NULL]
1	2022-01-05	[NULL]
1	2022-01-05	[NULL]
1	2022-01-05	[NULL]
1	2022-01-05	[NULL]

Customer_Registered Table: Contains detailed information about customers who have registered membership cards.

3.2. STEPS TO BUILD AN RFM TABLE FOR CUSTOMER SEGMENTATION

Tool: **Azure SQL**

Used to import the database and run queries for RFM analysis.

HOW TO DO

Process OTLP data to OLAP from Customer_Transaction table

Join the Customer_Transaction table with the Customer_Register table to obtain the necessary customer information.

Use SQL functions (Window Functions, CASE WHEN, DATEDIFF) to calculate RFM metrics and segment customers.

3.2. STEPS TO BUILD AN RFM TABLE FOR CUSTOMER SEGMENTATION

Step 1: Calculate Recency, Frequency, Monetery values

Recency: The number of days since the customer's most recent purchase.

Recency = 2022/09/01 - Last Purchase Date

Frequency: The average number of transactions a customer makes per year.

Frequency = Total Number of Transactions / Customer Contract Age (years)

Monetary: The average amount a customer spends per year.

Monetary = Total GMV / Customer Contract Age (years)

	CustomerID	Recency	Frequency	Monetary
1	1000000	31	0.25	18,750
2	1000004	92	0.25	23,750
3	1000009	31	0.25	18,750
4	1000036	31	0.5	37,500
5	1000047	62	0.25	28,750
6	1000049	62	0.25	23,750
7	1000051	62	0.25	18,750
8	1000056	92	0.25	23,750
9	1000057	62	0.25	21,250
10	1000066	92	0.25	26,250
11	1000075	62	0.25	18,750
12	1000097	31	0.25	18,750
13	1000109	92	0.25	28,750
14	1000134	31	0.25	17,500
15	1000136	92	0.25	26,250
16	1000137	92	0.25	18,750
17	1000141	62	0.25	23,750
18	1000151	92	0.25	17,500
19	1000157	31	0.5	37,500
20	1000160	31	0.25	26,250

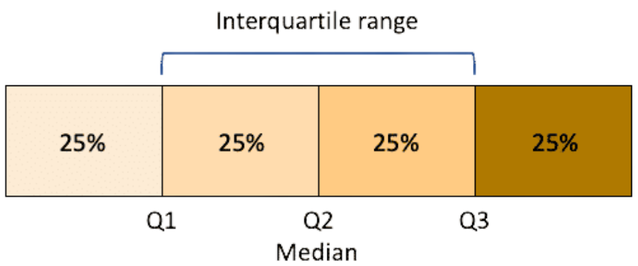
Note: The data were collected from June 2022 to September 1, 2022.

3.2. STEPS TO BUILD AN RFM TABLE FOR CUSTOMER SEGMENTATION

Step 2: Assign R, F, M scores based on the IQR method

CustomerID	Recency	Frequency	Monetary	R	M	F
1000000	31	0.25	18,750	3	2	2
1000004	92	0.25	23,750	1	3	2
1000009	31	0.25	18,750	3	2	2
1000036	31	0.5	37,500	3	3	4
1000047	62	0.25	28,750	2	3	2
1000049	62	0.25	23,750	2	3	2
1000051	62	0.25	18,750	2	2	2
1000056	92	0.25	23,750	1	3	2

1. Sort the values of each column (Recency, Frequency, and Monetary) in ascending order.
2. Calculate the rank for each value in the column.
3. Divide each value into four groups using the IQR (quartile) method.
4. Assign scores from 1 to 4 for Recency, Frequency, and Monetary (where 4 represents the best group and 1 represents the worst group).



Recency Scoring

(Lower Recency values indicate better customer activity)

- Min → Q1: Score 4
- Q1 → Q2: Score 3
- Q2 → Q3: Score 2
- Q3 → Max: Score 1

Frequency and Monetary Scoring

(Higher values indicate better customer performance)

- Min → Q1: Score 1
- Q1 → Q2: Score 2
- Q2 → Q3: Score 3
- Q3 → Max: Score 4

3.2. STEPS TO BUILD AN RFM TABLE FOR CUSTOMER SEGMENTATION

Step 3: Concatenate R, F, and M to create the RFM score

	CustomerID	R	M	F	RFM
1	1000000	3	2	2	322
2	1000004	1	3	2	123
3	1000009	3	2	2	322
4	1000036	3	3	4	343
5	1000047	2	3	2	223
6	1000049	2	3	2	223
7	1000051	2	2	2	222
8	1000056	1	3	2	123
9	1000057	2	2	2	222
10	1000066	1	3	2	123
11	1000075	2	2	2	222

For example

R = 3

F = 2

M = 2

→ **RFM score = 322**

After scoring R, F, and M individually, the scores are concatenated to create the RFM score.

3.2. STEPS TO BUILD AN RFM TABLE FOR CUSTOMER SEGMENTATION

Step 3: Concatenate R, F, and M to create the RFM score

	RFM	Nb_of_customers
1	344	103,730
2	122	89,612
3	311	73,624
4	144	70,401
5	322	69,472
6	222	67,362
7	111	66,325
8	244	57,205
9	211	49,587
10	133	47,870
11	333	47,767
12	233	35,946
13	343	31,106
14	143	26,097
15	243	25,666
16	123	9,739
17	332	7,815
18	323	7,390
19	223	7,355
20	321	5,736
21	132	4,480
22	232	3,962
23	121	3,670

	RFM	Nb_of_customers
24	221	3,607
25	242	2,358
26	112	2,235
27	212	1,589
28	312	1,587
29	422	1,539
30	432	1,446
31	334	1,285
32	134	1,121
33	241	1,073
34	411	982
35	234	924
36	444	815
37	342	802
38	421	789
39	443	761
40	442	655
41	341	365
42	142	300
43	331	264
44	441	237
45	231	217
46	431	148
47	423	133

48	434	113
49	141	102
50	131	96
51	433	94
52	412	25
53	124	14
54	224	12
55	324	10
56	424	2

56 **different RFM scores**

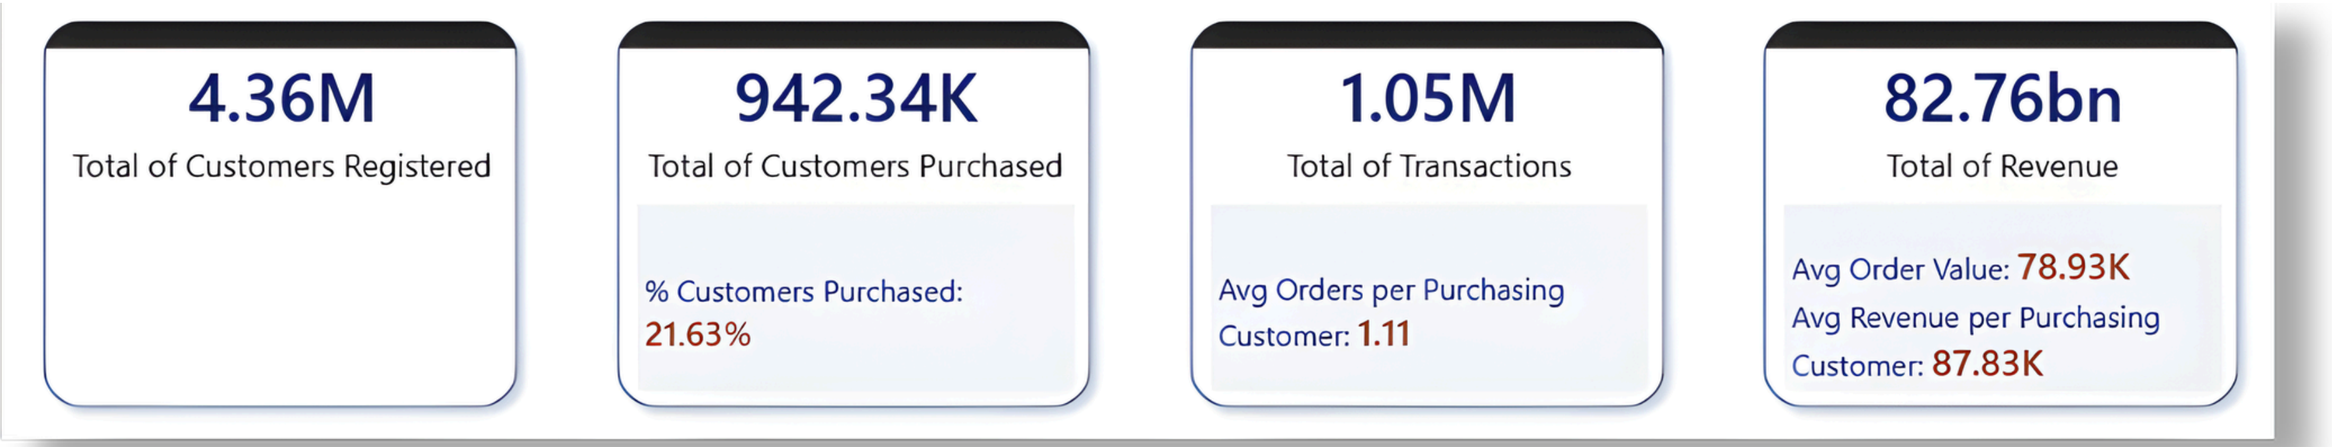
which are then mapped to customer segments based on the BCG matrix.

3.2. STEPS TO BUILD AN RFM TABLE FOR CUSTOMER SEGMENTATION

Step 4: Map RFM scores to customer segments based on the BCG Matrix.

BCG Matrix	Customer Segment	RFM Score	Description
Star	**VIP Customers**	333, 334, 343, 344, 433, 434, 443, 444	Customers who **buy recently**, **frequently**, and **spend the most**. They are the most valuable customers.
Cash Cows	**Loyal Customers**	232, 233, 234, 242, 243, 244, 332, 342, 432, 442	Customers who **buy regularly** and **maintain steady spending**.
Question Marks	**Potential Customers**	223, 224, 312, 321, 322, 323, 324, 331, 341, 412, 421, 422, 423, 424, 431, 441	Customers who **buy recently**, have low purchase frequency or spending, but **showing potential for future growth**.
Dogs	**At-Risk Customers**	122, 123, 124, 132, 133, 134, 142, 143, 144	Customers who **used to buy frequently or spend well** but have **not bought recently** and may stop buying.
	Occasional Customers	111, 112, 121, 131, 141, 211, 212, 221, 222, 231, 241, 311, 411	Customers who **buy occasionally** and have **low spending**

04 Customer Analysis and Solutions



Two key problems can be identified from the KPI cards:

KEY PROBLEMS

ACTIVATION

Only *21.63%* of registered customers have made a purchase, indicating a low conversion from sign-up to first transaction.

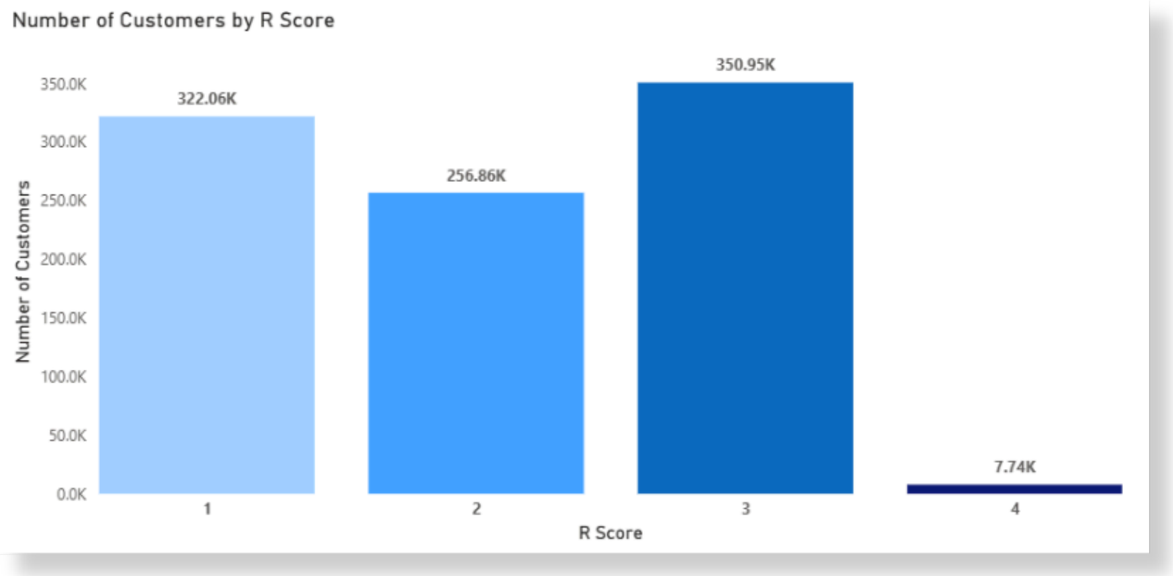
Weak onboarding flow and lack of first-purchase incentives to convert registered users.

RETENTION

Purchasing customers average only *1.11* orders, suggesting predominantly one-time purchase behavior.

No loyalty program or post-purchase engagement, failing to build repeat purchase habits.

350K R=3 customers represent a significant opportunity to drive retention through conversion to R=4.



R Score	Average Recency Value
1	92.00 days
2	62.44 days
3	31.44 days
4	20.07 days

- *Only 0.83% of customers are in the R=4 group, which shows that very few customers have bought recently (within the last 30 days). On the other hand, R=1 customers make up 34.35% of the total, indicating poor retention overall.*
- *The R=3 group is the best opportunity to focus on. It is the largest segment, customers have purchased fairly recently, and they are only about 11 days away from becoming R=4. Because they are already close and easier to activate, converting R=3 customers into R=4 should be the main strategy to increase the number of recent buyers.*

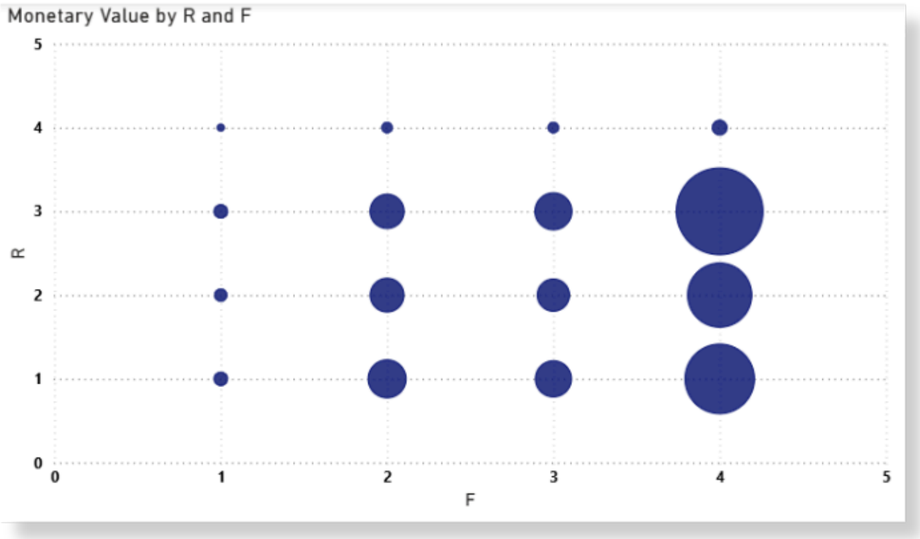
Prioritize converting R=3 & F=4 (14.51%) and re-engaging inactive loyal customers in R=1 & F=4 (10.33%)

% Customer Count with R & F Score

R | F	1	2	3	4
1	7.31%	10.99%	5.71%	10.33%
2	5.46%	8.35%	4.38%	9.20%
3	8.02%	8.81%	6.09%	14.51%
4	0.11%	0.26%	0.19%	0.26%

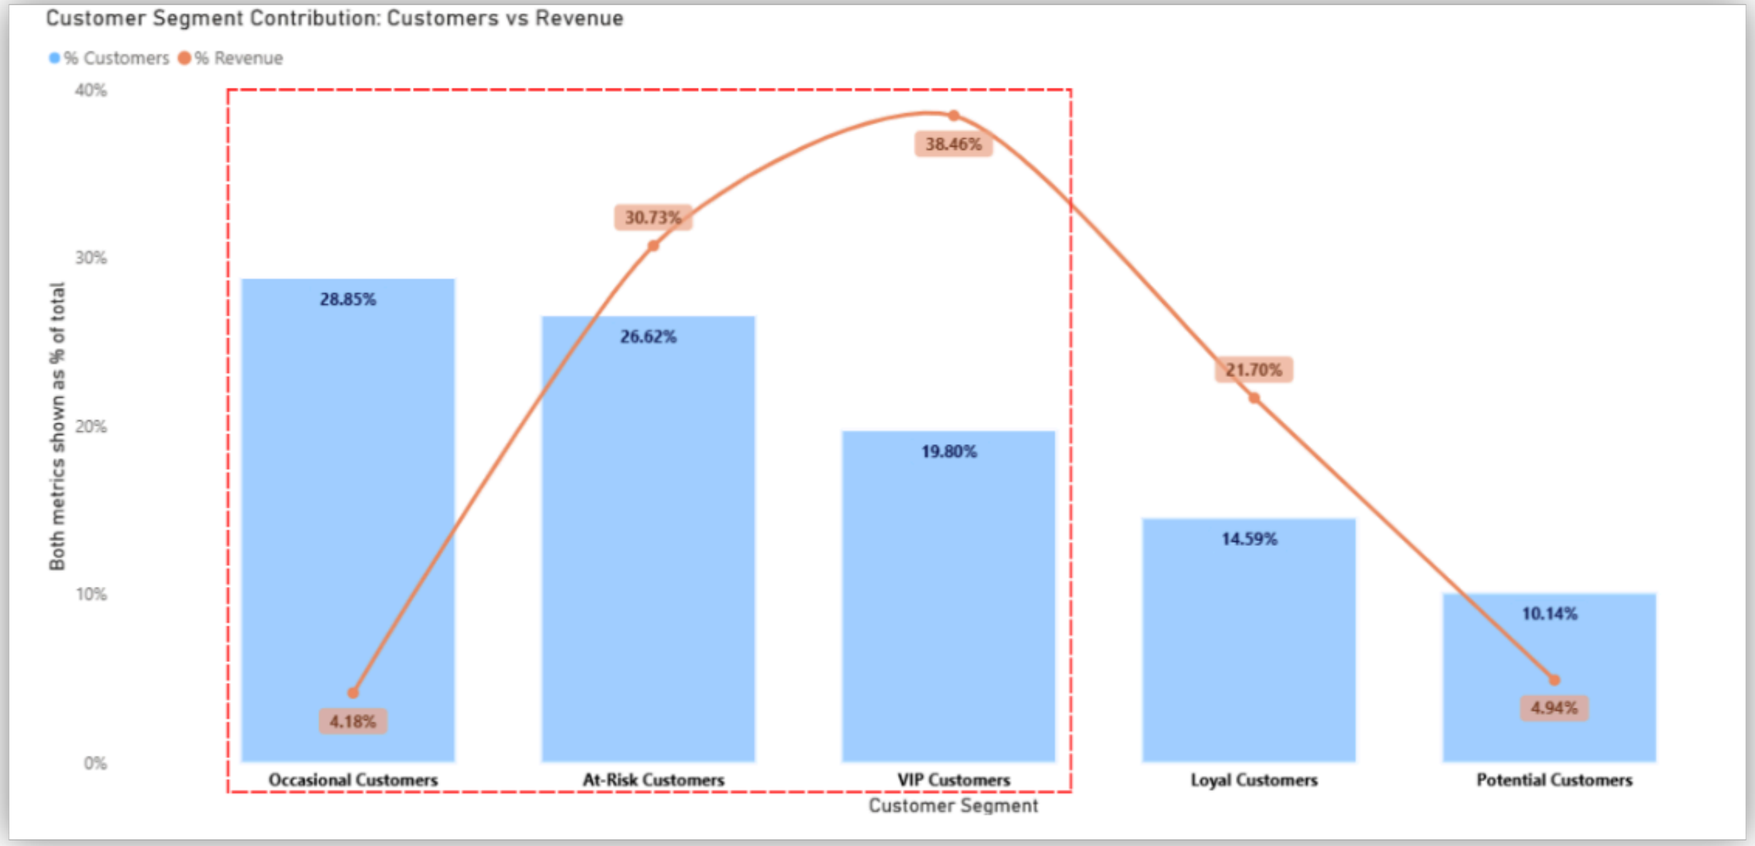
- *Within the R=3 tier, the R=3 & F=4 segment (14.51%) emerges as the single largest group in the matrix, consisting of high-frequency customers who are close to purchasing again, making the R=3 → R=4 conversion both low-cost and high-impact.*
- *Another priority segment is R=1 & F=4 (10.33%), representing previously loyal customers who have become inactive and require targeted win-back efforts.*
- *Combined, these two segments represent nearly 25% of the total base, and should be addressed through distinct campaigns: a conversion trigger for R=3 & F=4, and personalized re-engagement for R=1 & F=4.*

Revenue mostly comes from high-frequency (F=4) customers across all R scores, so it's important to keep them engaged.



- *The bubble chart displays revenue by R and F scores, where bubble size represents monetary value. A clear trend is that as F increases from 1 to 4, bubble size also increases across all R levels. This shows that purchase frequency drives revenue more than recency.*
- *The F=4 group generates most of the revenue, with R=3 & F=4 being the highest, followed by R=1 & F=4 and R=2 & F=4. Meanwhile, F=1 and F=2 segments contribute very little, even if customers purchased recently.*
- *Overall, revenue is concentrated in high-frequency customers, and any drop in their engagement will directly impact total revenue.*

~70% of revenue comes from <50% of customers



At-Risk Customers
30.73% of revenue from 26.62% of customers — at churn risk

VIP Customers
38.46% of revenue from only 19.80% of customers

Occasional Customers
4.18% of revenue despite being the largest group at 28.85%

Customer Segment	% Revenue	% Customer Count	% Revenue / % Customer Count
At-Risk Customers	30.73	26.62	1.15
VIP Customers	38.46	19.80	1.94
Loyal Customers	21.70	14.59	1.49
Potential Customers	4.94	10.14	0.49
Occasional Customers	4.18	28.85	0.14

- **At-Risk Customers** account for 30.73% of revenue from 26.62% of customers → **losing them would mean nearly 1/3 of total revenue loss**, making retention the most critical priority.
- **VIP Customers** generate 38.46% of revenue from only 19.80% of customers; as a result, they are **the most revenue-efficient segment** (about 14 times more than an Occasional Customer).
- **Loyal Customers** have a revenue-per-customer ratio of approximately 1.5, ranking second only to VIP in segment efficiency → **strong candidates for VIP upgrade**.
- **Potential Customers** deliver about 3.5 times more value per customer than Occasional Customers → **worth nurturing with targeted campaigns**.
- **Occasional Customers**, despite being the largest group (28.85%), contribute only 4.18% of revenue → **the lowest priority for investment**.

SOLUTIONS

BCG Matrix	Customer Segment	Solutions
Star	**VIP Customers** **- Retain & reward**	• Launch VIP program: priority support, birthday gifts, free shipping. • Send personalized product recommendations based on purchase history. • If VIP hasn't bought in 25–30 days → send a retention offer immediately.
Cash Cows	**Loyal Customer** **- Upgrade to VIP**	• Show how close they are to the VIP segment (for example, "2 more orders to become VIP customer"). • Offer bundle deals and cross-sells to increase order value and purchase frequency. • Give points for repeat purchases - more buys = more rewards.
Question Marks	**Potential Customers** **- Drive next purchase**	• Send a 3–5 email welcome sequence highlighting product value & tips. • Offer a short-term discount (for example, 10% off the next order within 7 days). • Test messaging: price, benefits, or social proof.

SOLUTIONS (continued)

BCG Matrix	Customer Segment	Solutions
Dogs	**At-Risk Customers** **- Win-Back strategy**	• Send a personalized message about their past orders and the special offers. • Create urgency: limited-time discount or bonus points. • If no response after 2–3 tries → reduce contact frequency to avoid annoying the customers.
	Occasional Customers **- Keep costs low**	• Use only automated channels: newsletter, seasonal promotion, and major sales. • Avoid paid retargeting or manual outreach. • Monitor activity: if buying more frequently → move to “Potential Customers” flow.

05

SQL Code and Customer List by Segments

SQL CODE

Calculate the Recency, Frequency, and Monetary (RFM) metrics.

```
WITH Customer_Statistics AS(
SELECT CustomerID,
       DATEDIFF(DAY, MAX(Purchase_Date), '2022/9/1') AS Recency,
       CASE WHEN DATEDIFF(YEAR, created_date, '2022/9/1') = 0 THEN 0
            ELSE ROUND(1.0 * COUNT(Transaction_ID)/DATEDIFF(YEAR, created_date, '2022/9/1'), 2)
       END AS Frequency,
       CASE WHEN DATEDIFF(YEAR, created_date, '2022/9/1') = 0 THEN 0
            ELSE ROUND(1.0 * SUM(GMV)/DATEDIFF(YEAR, created_date, '2022/9/1'), 2)
       END AS Monetary
FROM Customer_Transaction ct JOIN Customer_Registered cr ON ct.CustomerID = cr.ID
WHERE ct.Purchase_Date IS NOT NULL AND ct.Purchase_Date < '2022-09-01'
GROUP BY CustomerID, created_date
),
```

Sort the metrics in ascending order and assign row number.

```
rn_RFM AS (
SELECT cs.*,
       ROW_NUMBER() OVER (ORDER BY Recency ASC) AS rn_Recency,
       ROW_NUMBER() OVER (ORDER BY Frequency ASC) AS rn_Frequency,
       ROW_NUMBER() OVER (ORDER BY Monetary ASC) AS rn_Monetary
FROM Customer_Statistics cs
),
```

Calculate the R, F, and M scores using the IQR method.

```
Customer_RFM AS (
SELECT CustomerID, Recency, Frequency, Monetary,
       CASE WHEN Recency >= MIN(Recency)
                 AND Recency < (SELECT rr.Recency FROM rn_RFM rr WHERE rn_Recency = (SELECT ROUND(MAX(rn_Recency)*0.25,0) FROM rn_RFM)) THEN '4'
            WHEN Recency >= (SELECT rr.Recency FROM rn_RFM rr WHERE rn_Recency = (SELECT ROUND(MAX(rn_Recency)*0.25,0) FROM rn_RFM))
                 AND Recency < (SELECT rr.Recency FROM rn_RFM rr WHERE rn_Recency = (SELECT ROUND(MAX(rn_Recency)*0.5,0) FROM rn_RFM)) THEN '3'
            WHEN Recency >= (SELECT rr.Recency FROM rn_RFM rr WHERE rn_Recency = (SELECT ROUND(MAX(rn_Recency)*0.5,0) FROM rn_RFM))
                 AND Recency < (SELECT rr.Recency FROM rn_RFM rr WHERE rn_Recency = (SELECT ROUND(MAX(rn_Recency)*0.75,0) FROM rn_RFM)) THEN '2'
       ELSE '1'
       END AS R,
       CASE WHEN Frequency >= MIN(Frequency)
                 AND Frequency < (SELECT rr.Frequency FROM rn_RFM rr WHERE rn_Frequency = (SELECT ROUND(MAX(rn_Frequency)*0.25,0) FROM rn_RFM)) THEN '1'
            WHEN Frequency >= (SELECT rr.Frequency FROM rn_RFM rr WHERE rn_Frequency = (SELECT ROUND(MAX(rn_Frequency)*0.25,0) FROM rn_RFM))
                 AND Frequency < (SELECT rr.Frequency FROM rn_RFM rr WHERE rn_Frequency = (SELECT ROUND(MAX(rn_Frequency)*0.5,0) FROM rn_RFM)) THEN '2'
            WHEN Frequency >= (SELECT rr.Frequency FROM rn_RFM rr WHERE rn_Frequency = (SELECT ROUND(MAX(rn_Frequency)*0.5,0) FROM rn_RFM))
                 AND Frequency < (SELECT rr.Frequency FROM rn_RFM rr WHERE rn_Frequency = (SELECT ROUND(MAX(rn_Frequency)*0.75,0) FROM rn_RFM)) THEN '3'

),
```

Combine the R, F, and M scores into a single RFM score, then use it to determine the customer segments.

```
RFM AS (
SELECT cr.*, CONCAT(R, F, M) AS RFM
FROM Customer_RFM cr
)
SELECT rfm.*, cs.Customer_Segment, cs.BCG_Matrix
FROM RFM rfm JOIN customer_segment cs ON rfm.RFM = cs.RFM
```
